

*Xothermic, Inc. provides specially designed controls for customer applications. A full-sized enclosure is not always what works best for a particular project. Detailed below are some electrical controls, specifically constructed for unique applications.*

*The circuit board shown above was designed to improve safety performance, minimize repeat enclosure wiring and assist with debugging. With self-checking features and force-guided relays, the board fits neatly into a skid-mounted enclosure (right). This locally mounted enclosure saves on field wiring along with floor space, features not possible in the space provided with traditional enclosure wiring methods.*

*Peak pressure detection unit constructed from custom designed stainless steel enclosure. The compact interior houses PLC, power supplies and digital read-out.*
